

MISSISSIPPI VALLEY UNIFORM REGIONAL BARLEY NURSERY

2010

FOR OFFICIAL USE ONLY

UNITED STATES DEPARTMENT OF AGRICULTURE
AGRICULTURAL RESEARCH SERVICE
NORTHERN PLAINS AREA
AND
COOPERATING STATE AGRICULTURAL EXPERIMENT STATIONS

MISSISSIPPI VALLEY UNIFORM REGIONAL BARLEY NURSERY 2010

Compiled by Michael C. Edwards

This is a joint progress report of cooperative investigations underway in the State Agricultural Experiment Stations and the Agricultural Research Service of the United States Department of Agriculture containing preliminary data that have not been sufficiently confirmed to justify general release; interpretations may be modified with additional experimentation. Confirmed results will be published through established channels. The report is primarily a tool for use of cooperators and their official staffs and to those persons having direct and special interest in the development of agricultural research programs.

This report includes data furnished by the State Agricultural Experiment Stations, the provinces of Manitoba and Saskatchewan, Agriculture and Agri-Food Canada, and the Agricultural Research Service, and was compiled in the USDA-ARS Cereal Crops Research Unit at North Dakota State University. The report is not intended for publication and should not be referred to in literature citations nor quoted in publicity or advertising. Use of the data may be granted for certain purposes upon written request to the agency or agencies involved.

ACKNOWLEDGEMENT: Dr. James Hammond [Department of Plant Sciences, North Dakota State University] developed the computer program used to evaluate and compile the data for most of this report.

Saskatoon, Saskatchewan	Bryan Rossnagel, B. L. Harvey, Tom Zatorski University of Saskatchewan
Madison, Wisconsin	H. Kaeppeler, J. Mochon, University of Wisconsin

2010 Mississippi Valley Barley Nursery

Summary

Eight locations contributed useable data for this year's report. The reader is referred to the "Nursery Conditions" section immediately following this summary for other comments concerning specific locations.

Average planting date was April 22nd, 5 days earlier than the 30-year average, while average heading date was 4 days later than the average. Average planting date was 10 days earlier than last year. Heading date (June 29th) was 11 days earlier than last year.

Average yield (5116 kg/ha or 95 bu/a) was well above the 30-year average, but less than last year's average of 5978 kg/ha. Entries with the best yields were SR424, 2ND24388, ND22421, 2ND24238, and Pinnacle.

Three stations reported test weight; the average of 63.1 kg/hl was lower than that of last year, but slightly higher than the 30 year average (61.2). Entries with the greatest test weights were 2ND26333, 2ND26328, 2ND24238, Lacey, and M145. The latter was best among experimental six-rows.

Most locations did not report lodging data. Only Madison provided percent lodging data. Average plant height was 85.1 cm – a bit taller than the 30 year average. Shortest entries were 2ND26328, 2ND26333, ND26249, ND22421, and 2ND24238.

Kernel plumpness data were reported from Bottineau and Sidney. Please refer to Table 18 for further information.

Disease data from the Cereal Research Centre in Winnipeg are posted in Table 19. The Brandon location also reported disease data that can be found in Tables 20 and 21.

NURSERY CONDITIONS

MANITOBA:

BRANDON: Previous crop: RR canola
Soil type: Pipestone clay, heavy textured
Fertilizer available: 40 kg/ha N; 40 kg/ha P; >100 kg/ha K.
added: 40 kg/ha N
Remarks: Data not used. The growing season was extremely wet in May and June; wet in July and August. Emergence was sporadic and incomplete owing to flooding debris. Heading and maturity notes were not taken as unique weather conditions caused all plots to head/mature within a 36 hr period. Onset of physiological maturity was sudden (all plots ripe within 48 hrs). There was sporadic grazing damage from deer. All in all, a very difficult growing season.

MINNESOTA:

CROOKSTON: Previous crop: soybeans
Soil type: Wheatville, silt-loam.
Fertilizer available: 19 lbs/a N; 16 lbs/a P; 306 lbs/a K.
added: 208 lbs/A of 46-0-0 and 85 lbs/A of 11-52-0.
Remarks: .

MORRIS: Previous crop: soybeans.
Soil type: Nutley clay.
Fertilizer available: pH 6.4; Bray P 23 ppm; K 135 ppm.
added: none.
Remarks: .

NORTH DAKOTA:

CARRINGTON: Previous crop: soybeans.
Soil type: Heimdal loam, sandy loam
Fertilizer available: 25 lbs/a N; 14 lbs/a P; 203 lbs/a K
added: 125 lbs/a N
Remarks: Planting moisture was adequate at planting. Crop emergence was excellent. No disease or lodging problems were noted. Grain protein was high at this location.

FARGO: Previous crop: soybeans
Soil type: Fargo, silty clay loam
Fertilizer available: 11 lbs/a N; 34 lbs/a P; 464 lbs/a K
added: 110 lbs/a N; lbs/a P.

	Remarks:	Planting moisture was adequate this spring. Crop emergence was excellent. Powdery mildew was prevalent this year at Fargo. Lodging and stem breakage were also noted at this location.
OSNABROCK:	Previous crop:	Canola
	Soil type:	Barnes-Svea loam, loam.
	Fertilizer available:	25 lbs/a N; . lbs/a P; lbs/a K.
	added:	85 lbs/a N; lbs/a P; lbs/a K.
	Remarks:	Soil moisture at planting was adequate. Crop emergence was delayed due to soil crusting. After light harrowing, the crop emerged with minimal damage and developed nicely. Yields were above average at this location.
BOTTINEAU:	Previous crop:	canola.
	Soil type:	.
	Fertilizer available:	.
	added:	.
	Remarks:	The nursery was seeded into a good seedbed with excellent moisture. The early summer progressed normally and the nursery had good plant development. Harvest was delayed more than a week due to rains. Harvest went well once we started with good yields.
MONTANA:		
SIDNEY:	Previous crop:	Sugarbeets.
	Soil type:	.
	Fertilizer available:	.
	added:	.
	Remarks:	The nursery was seeded into a nice seedbed with good moisture. The growing season progressed normally with timely rains. The cooperator only had to irrigate once during the growing season. The nursery had excellent plant development and little disease or lodging. Harvest went well, with dry conditions, good yields and acceptable statistics.
WISCONSIN:		
MADISON:	Previous crop:	soybeans
	Soil type:	St. Charles, loam
	Fertilizer available:	.
	added:	none
	Remarks:	Everything was early in 2010. Planting was done on 4-15. Mean temperature in April was 52.4 F with 4.5 inches of total rainfall. May, June, July and August warmed up faster and sooner, and the rainfall kept the plots unusually wet for most of the summer. May's mean temperature was 60.1 F and June had a mean temperature of 68.0 F. Total rainfall for May and June combined was 13.8 inches.

July and August were also hot and wet with combined rainfall of 8.9 inches, and a combined mean temperature of 72.8 F. The MVBN was harvested on July 21. Although we had more than adequate rainfall, the high temperatures and disease pressure, combined with the "shortening up" of the season caused yields and test weights to be low. Lodging pressure was typical for the number of storms we had. Levels of powdery mildew were moderate to heavy.

SASKATCHEWAN:

KERNEN:	Previous crop:	.
	Soil type:	.
	Fertilizer available:	.
	added:	.
	Remarks:	Nursery lost.

d *Septoria passerinii* isolate

e *Cochliobolus sativus* isolate

f Reaction categories: 10=VS, 9=S, 7=MS, 5=MR-MS, 3=MR, 1=R; x,y main and secondary reactions

g Reaction categories: R, MR, MS ,S

h Reaction categories: R, (MR), (MS), S; () rarely-used
categories

i Reaction categories: 0-9 scale: 0=no visible lesions; 4= small; 9= very large, coalescing

x(y) = segregating; x(y)= one plant only segregating or seed mix; "-" = no reading (poor or no growth);

B= blotchy symptoms;

? = equivocal, based on one plant only, or plants small and difficult to read;

Net Blotch = *Pyrenophora teres*, rating scale 1-9 where 9 is susceptible.

Net blotch was only rated if significantly present.

Spot Blotch = *Cochliobolus sativus*, rating scale 1-9 where 9 is susceptible.

Fusarium Head Blight

FHB = FHB visual score (0-5)

0 = no infection

1 = incidence low, up to 5% of spikes;
severity low, 1 or 2 kernels per spike affected (up to 7% of
head)

2 = incidence low to moderate, 5 to 15% of spikes infected;
severity low to moderate, 1 to 4 kernels (up to 15% of head)

3 = incidence moderate, 15 to 30% of heads;
severity moderate, 2 to 8 kernels (up to 25% of
head)

4 = incidence moderate to high, 30 to 50% of spikes infected;
severity moderate to high, 4 to 12 kernels (up to 40% of head)

5 = incidence high, 50% or more spikes affected;
severity high, 5 to 15+ kernels (up to 50%+ of head diseased)

DON = deoxynivalenol content, as determined by ELISA technique at AAFC-ECORC, Ottawa.
